CPSC 331 — Solutions for Tutorial Exercise #2

In this exercise you were asked to make sure that your Java development environment was correctly set up at school.

1. Please speak with your teaching assistant during Tutorial #2 or email the course instructor if you have problems with this.

2. Recall that *pathname* was the full path name that had been discovered when completing Development Exercise #2. Rather than creating or editing a `.bash_profile` file to include lines like the following,

   ```
   export CLASSPATH='$CLASSPATH:pathname'
   alias javac='javac -d pathname'
   ```

   create (or edit) one including the following lines instead:

   ```
   export CLASSPATH='$CLASSPATH:pathname:/usr/share/java/junit.jar'
   alias javac="javac -d pathname"
   ```

   There certainly be other ways to do this too, but this should work.

   Note: You will probably find it to be useful to extend your `CLASSPATH` at several times, later on this term.
